

GEN-X Robotic Vacuum

> Operator Guide

GEN-X Floor Care Robots boost productivity by freeing the operator from the floor machine, allowing them to complete other tasks while floors are being scrubbed or vacuumed. On average an operator spends only 30 minutes per shift with the robot, and all aspects of the user interface have been designed for ease of use.

1. The operator installs a clean filter bag and two clean cartridge air filters.

2. The operator selects the desired route on the touch screen and the robot begins.

3. If additional run time is required, the operator can exchange the battery pack.

4. Routine maintenance is simple, with unobstructed access to drive belts.
